Bearing Mounted

SFC-825
Flange Mounted

⚠ WARNING Follow the installation instructions in this manual carefully to ensure safe, reliable operation. All stated or implied manufacturer warranties are voided if this product is not installed in accordance with these instructions.

⚠ WARNING Failure to follow these instructions may result in product damage, equipment damage, and serious or fatal injury to personnel.

Clutch-Coupling Spline Drive Armatures **SFC-825 SFC-1000 SFC-1225 SFC-1525** **SFC-1525 Hi-Torque**

The illustration drawings, parts lists, and exploded views for these units can be found beginning on page 10.

A. Aligning the Shafts

In order for the clutch-coupling unit to operate properly, the mounting shafts of the motor and reducer or other hardware must be aligned with respect to each other before the unit is installed. The two shafts should be concentric with each other within .006 T.I.R., and angular alignment should be within 1/2 degree. (See to Figure 1)

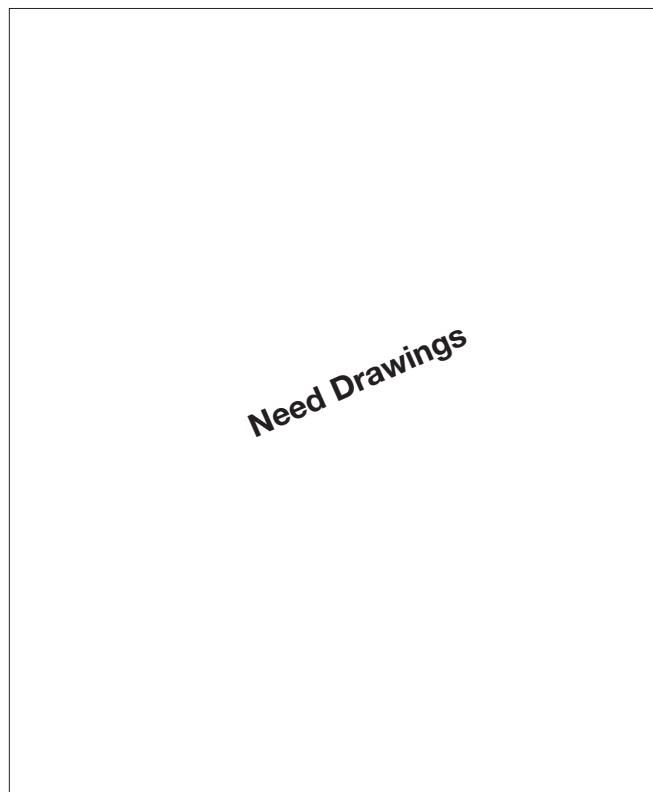

Figure 1

1. Use a straight-edge to check if the shafts are aligned with each other. For a more precise indication of alignment, use a dial indicator.
2. Adjust the position of the motor, reducer, or other hardware as required to achieve the correct alignment.
3. To be sure the shafts stay in alignment, drill holes for tapered dowel pins through the mounting bases of the motor, reducer, or other hardware and into the mounting surfaces. This procedure will ensure that, after the clutch-coupling has been installed, the shafts can easily be placed in proper alignment again by lining up the holes and secured by inserting the dowel pins.

B. Installing the Conduit Box

Install the conduit box on the field. Instructions for this procedure can be found with conduit box.

C. Mounting the Field-and-Rotor Assembly

Flange-Mounted Units

The fields and rotors are shipped separately for flange-mounted units. On some applications it will be necessary to mount the rotor first, and then bring the field into position. In other instances, the field will be mounted first, and then the rotor (mounted on a shaft) will be inserted into place.

1. Mounting the Field

- a. Care must be taken in selecting the location for mounting the field assembly. Pilot diameters are machined on the field mounting flange to aid in holding the field in the proper position.
- b. An appropriate pilot diameter must be provided on the mounting surface as well. (Figure 2)

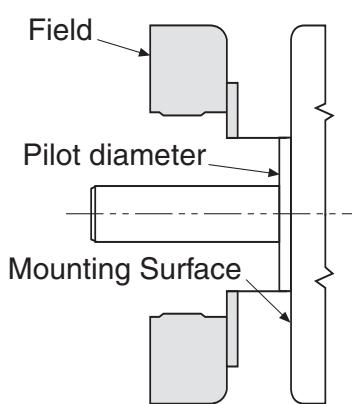

Figure 2

- c. The field assembly is then fastened in place with capscrews and lockwashers. (Figure 3)

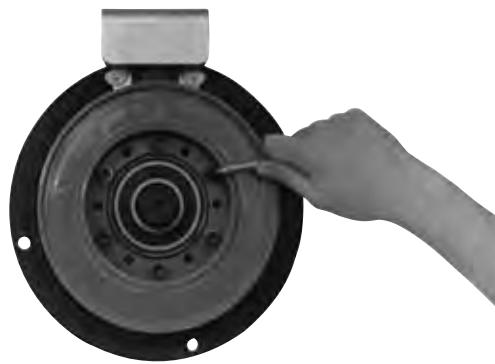

Figure 3

- d. After the unit is in place the mounting face and pilot diameter must be square and concentric with the shaft in accordance with the tolerances listed on the drawings. (Figure 4)

Figure 4

2. Mounting the Rotor

- a. Assemble the rotor to the rotor hub with capscrews and lockwashers. The rotor is reversible depending on the side from which the taperlock bushing must enter. A pilot diameter is machined on the rotor hub to assure a proper fit.
- b. The rotor hub is mounted on the shaft with a taperlock bushing. Be sure all parts are clean and free of dirt, chips, and burrs before assembling.
- c. Insert the bushing into the taper bore.
- d. Loosely assemble the two locking screws between the bushing and rotor.
- e. Insert the key into the shaft keyway. Prick punch the end of the keyway to ensure that the key cannot slide out.

- f. Slide the rotor assembly over the key and onto the shaft.
- g. Place the edge of the rotor 1/16" - 1/8" before the line that is inscribed into the O.D. of the field.
- h. Lock the rotor into place by alternately tightening the two locking screws in the bushing. As the screws are tightened, the rotor normally is pulled 1/16" - 1/8" **further onto the bushing (towards the field)**. When the rotor is secured tightly on the bushing, the edge of the rotor must be approximately even with the line inscribed in the field. The overall axial dimension from the face of the rotor to the back of the field flange is shown on the illustration drawings. Squareness and concentricity tolerances must also be held as specified on the drawings to assure that the unit functions correctly.

Bearing Mounted Units

In bearing-mounted units, the field and rotor are shipped as an assembly. Either this assembly or the armature and hub assembly can be mounted on the shaft first, depending on the characteristics of each application.

1. Field and rotor assemblies are mounted on the shaft a taperlock bushing. Insert the bushing into the tapered bore.
2. Loosely assemble the two locking screws between the taperlock bushing and the rotor.
3. Insert the key into the shaft keyway. Prick punch the end of the keyway to ensure that the key cannot slide out.
4. Slide the rotor assembly onto the shaft over the key.
5. If the armature has been secured to the shaft first, adjust the rotor's position to allow a 1/32-inch gap between the two faces. (See Figure 8.)
6. Lock the assembly into place by alternately tightening the two locking screws.
7. A tab or torque arm on the field is used to prevent rotation of the field caused by normal bearing drag. Insert either a pin in the U-slot or a fork around the torque arm to prevent this rotation. Under no circumstances, however, should the field be so tightly restrained as to preload the bearing. (For more information on torque tabs, see page 7.)

D. Assembling the Armature and Hub

These units contain a spline drive armature and hub. The armatures are shipped with a built-in autogap spring accessory. This device automatically maintains a gap of about 1/32" between the armature and rotor faces for the life of the units.

These units are shipped with the armature, splined armature adapter, and autogap already assembled. The splined hub, retainer ring, and bushing are shipped as separate parts.

Follow these instructions to assemble the splined armature assembly and hub:

1. Place the armature assembly on a flat surface with the segmented side up.
2. Push the splined hub, with the retainer ring groove down, through the autogap spring and splined armature adapter (Figure 5). (Considerable force is required to start the hub through the armature.)

Figure 5

3. Turn the armature assembly over, and insert the retainer ring in the groove. (Figure 6)

Figure 6

4. Slide the armature assembly up against the retainer ring.

E. Mounting the Armature-Hub Assembly

1. Insert the bushing into the retainer ring side of the splined hub. The clearance holes in the bushing flange should line up with the tapped holes in the splined hub. (Figure 7)

Figure 7

2. Slide the complete assembly on the shaft and place it in contact with the rotor.
3. Tighten the bushing capscrews, taking a few turns at a time on each capscrew. As the capscrews are tightened, the armature will back away slightly from the rotor. There should be a clearance of $1/16"$ between the armature and rotor when the capscrews are completely tight.
4. When the assembly has been secured on the shaft, push the armature against the rotor face. When the armature is released, it will spring back about $1/32"$. (Figure 8)

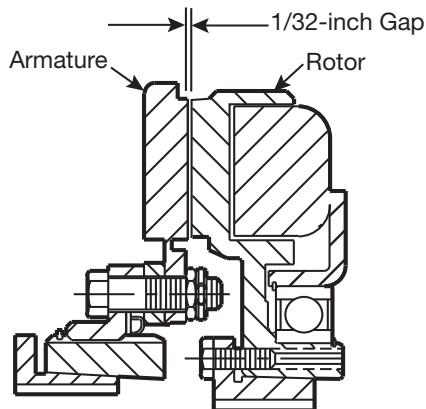

Figure 8

Once this gap is set, it will be automatically maintained for the life of the unit.

Torque Tabs

Clutches

Many Warner Electric clutch assemblies have a bearing mounted stationery field. By design the bearing maintains its proper position between the field and rotor making it easy for the customer to mount the field-rotor assembly. However, the bearing has a slight drag which tends to make the field rotate with the rotor if not restrained. And, since the field has lead wires attached, it must be restrained to prevent rotation and pulling of these wires. To counteract this rotational force, the field has a "torque tab" to which the customer must attach an appropriate anti-rotational restraint.

A few hints regarding proper torque tab restraints are in order. First and foremost, it is important to recognize that the force to be overcome is very small and the tab should not be restrained any manner which will preload the bearing. For example, if the clutch is mounted with the back of the field adjacent to a rigid machine member the customer should not attach a capscrew tightly between the tab and the machine member. This may pull the tab back against the rigid member as shown in Figure 1 and preload the bearing. The recommended methods are illustrated in Illustrations 2, 3, and 4. The method selected is primarily a matter of customer preference or convenience.

| Watts | 29 | 28 | 30 | 33 | 40 | 37 | 34 | 40 | 38 |
| Coil Build-Up-Milliseconds | 222 | 200 | 245 | 180 | 200 | 225 | 256 | 275 | 283 |
| Coil decay-Milliseconds | 105 | 120 | 100 | 115 | 120 | 130 | 123 | 105 | 90 |

| Unit Size | SF-1225 | | | SF-1525 | | | SF-1525 HT | | |
|------------------------------|---------|------|-------|---------|------|-------|------------|-------|--|
| Voltage - DC | 6 | 24 | 90 | 6 | 24 | 90 | 6 | 90 | |
| Resistance @ 20°C-Ohms | 1.21 | 19.5 | 268.3 | 1.11 | 15.5 | 239.1 | .55 | 113.4 | |
| Current – Amperes | 4.97 | 1.23 | .34 | 5.41 | 1.55 | .38 | 10.83 | .794 | |
| Watts | 30 | 30 | 30 | 32 | 37 | 34 | 65 | 72 | |
| Coil Build-Up – Milliseconds | 475 | 440 | 510 | 505 | 535 | 575 | 480 | 560 | |
| Coil decay-Milliseconds | 240 | 230 | 220 | 230 | 237 | 215 | 210 | 160 | |

Notes: Build-up time equals current to approx.* 90% of steady state value and flux to 90%

Decay time equals current to approx.* 10% of steady state value and flux to 10%.

*Approx. because current leads or lags flux by a small amount.

Burnishing and Maintenance

Burnishing

Intimate metal to metal contact is essential between the armature and the metal rings (poles) of the magnet or rotor. Warner Electric clutches and brakes leave the factory with the friction material slightly undercut to assure good initial contact.

Normally, the desired wearing-in process occurs naturally as the surfaces slip upon engagement. The time for wear-in, which is necessary to obtain the ultimate torque of the unit, will vary depending on speed, load, or cycle duty.

If maximum torque is required immediately after installation, the unit should be burnished by slipping the friction surfaces together at reduced voltage. It is recommended that the burnishing be done right on the application, if at all possible.

Burnishing at high speed will result in a smoother wear-in pattern and reduce the time for burnishing. The voltage should be set at approximately 30% or 40% of the rated value.

The unit should be cycled on and off to allow sufficient time between slip cycles to prevent overheating.

When a Warner Electric brake or clutch is properly assembled and installed, no further servicing, lubrication, or maintenance should be required throughout the life of the unit.

Maintenance

Wear Pattern: Wear grooves appear on the armature and rotor surfaces. This is a normal wear condition, and does not impair functioning of the unit. Normally, the rotor and armature, as a mating pair, will wear at the same rate. It is the usual recommendation that both components be replaced at the same time.

Remachining the face of a worn armature is not recommended. If a replacement armature is to be used with a used rotor, it is necessary to remachine the worn rotorface. In refacing a rotor: (1) machine only enough material to clean up the complete face of the magnet; (2) hold the face within .005" of parallel with the mounting plate; and (3) undercut the molded facing material .002"-.004" below the metal poles.

Heat: Excessive heat and high operating temperatures are causes of rapid wear. Units therefore, should be ventilated as efficiently as possible, especially if the application requires fast, repetitive cycle operation.

Foreign Materials: If units are used on machinery where fine, abrasive dust, chips or grit are dispelled into the atmosphere, shielding of the brake or clutch may be necessary if maximum life is to be obtained.

Where units are used near gear boxes or transmissions requiring frequent lubrication, means should be provided to protect the friction surfaces from oil and grease to prevent serious loss of torque.

Oil and grease accidentally reaching the friction surfaces may be removed by wiping with a rag dampened with a suitable cleaner, which leaves no residue. In performing this operation, do not drench the friction material.

If the friction materials have been saturated with oil or grease, no amount of cleaning will be completely effective. Once such a unit has been placed back in service, heat will cause the oil to boil to the surface, resulting in further torque loss.

Torque Loss: If a brake or clutch slips or loses torque completely, the initial check should be the input voltage to the field as follows:

90-Volt Series: Connect a DC voltmeter with a range of 0-100 or more directly across the field terminals. With the power on and the potentiometer turned up, a normal reading is 90 volts, although 85 to 95 is satisfactory. The reading should drop as the potentiometer control is adjusted counterclockwise.

24-Volt Series: Use a DC voltmeter with a range of 0-30 volts or more. A normal reading is approximately 22-26 volts.

6-Volt Series: Use a DC voltmeter of approximately 0-15 volt range. A normal reading is from 5.5 to 6.5 volts.

The above checks normally are sufficient. Further checks may be made as follows: a low range ammeter, when connected in series with one field lead, will normally indicate approximately .40 amperes for the 90 volt units, 1.0 ampere for the 24 volt, and 3.5 amperes for the 6 volt series. These readings are with the power on and the potentiometer control in the maximum position.

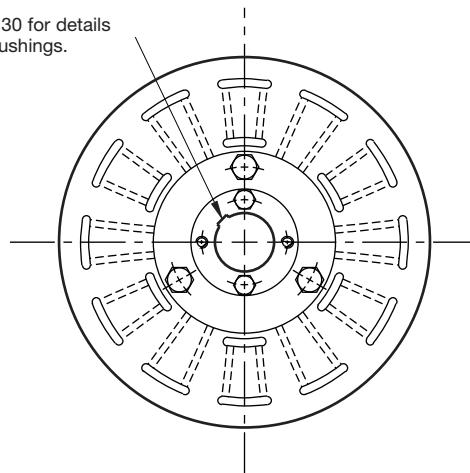

Ohmmeter checks should be made with the power off and the circuit open (to be certain, disconnect one lead to the field). Average resistance for the 90 volt series is 220 ohms; for the 24 volt, 20 ohms; and for the 6 volt series, 1.5 ohms. A very high or infinite resistance reading would indicate an open coil.

If the above checks indicate that the proper voltage and current is being supplied to the magnet, mechanical parts should be checked to assure that they are in good operating condition and properly installed.

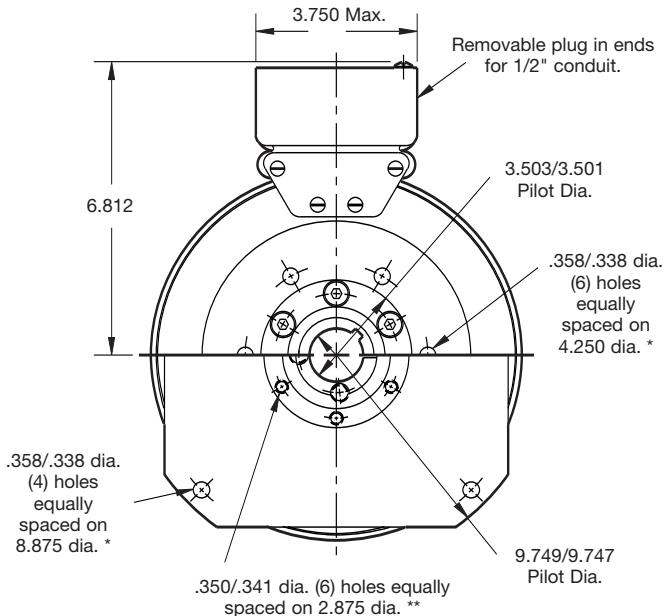

SFC-825 Clutch Coupling Flange Mounted

Drawing I-25564

See page 30 for details on Bushings.

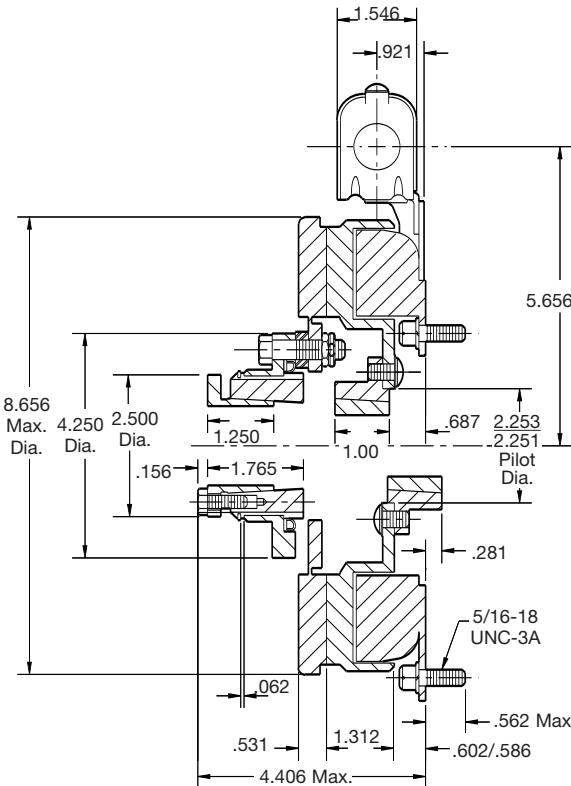

Armature View

**Field View
(Inside & Outside Mounted)**

Customer Shall Maintain:

1. Concentricity of field mounting pilot diameter with rotor mounting shaft within .006 T.I.R.
2. Squareness of field mounting face with rotor shaft within .006 T.I.R. measured at field mounting bolt circle.
3. Rotor mounting shaft concentric with armature mounting shaft within .006 T.I.R.
4. Angular alignment of shafts within 1/2 degree.

* Mounting holes are within .010 of true position relative to pilot diameter.

** Mounting holes are within .008 of true position relative to pilot diameter.

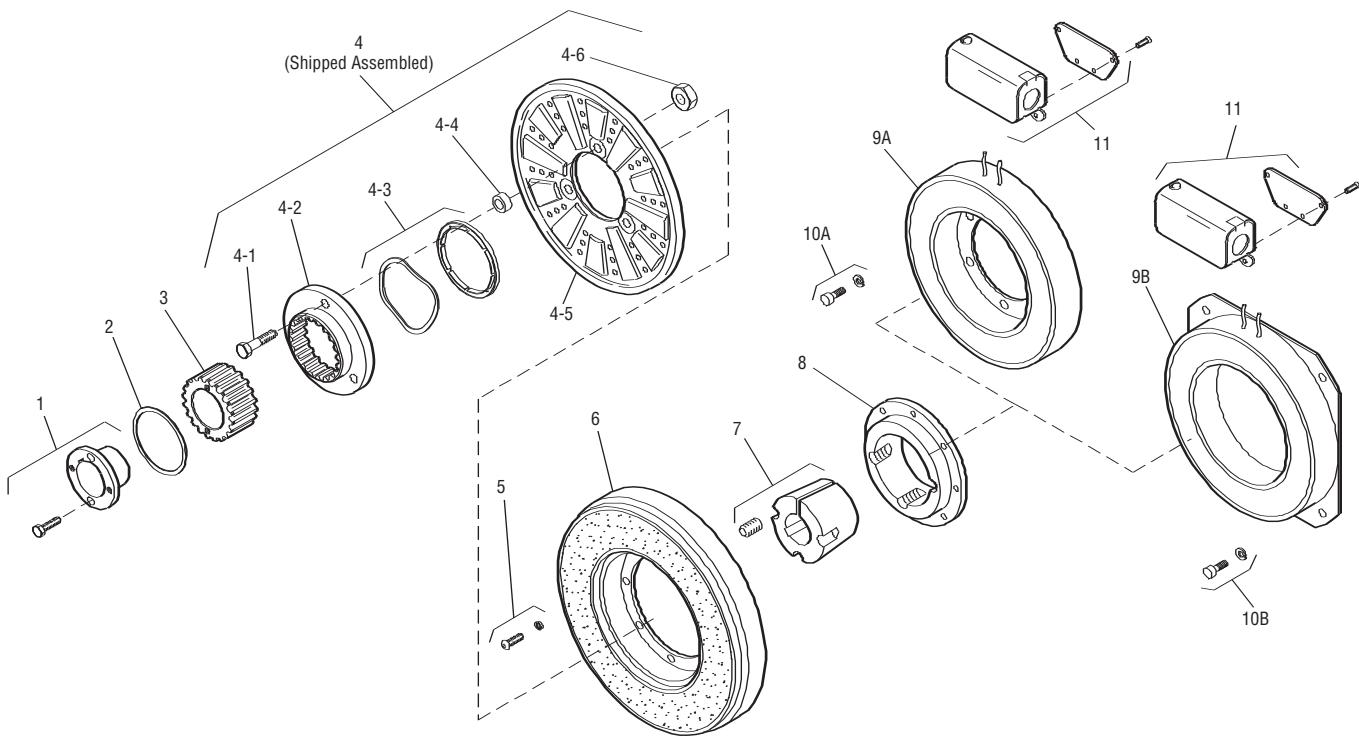

| | |
|------------------|----------------|
| Arm Shaft | .500 – 1.500 |
| Rotor Shaft | .500 – 1.250 |
| Static Torque | 125 lb. ft. |
| Maximum Speed | 4,000 rpm |
| Standard Voltage | D.C. 6, 24, 90 |

All dimensions are nominal unless otherwise noted.

Note: The two mating shafts on which the clutch is mounted must be mounted rigidly to prevent flexing during engagement. Any flexing will cause vibration and rapid clutchwear. The drive motor should not be mounted on the reducer "scoop" mount or other flexible mounts.

- Specify Inside or Outside Mounted for Item 5.
- Specify Inside Mounted for Items 9A and 10A or Outside Mounted for Items 9B and 10B.

Example:

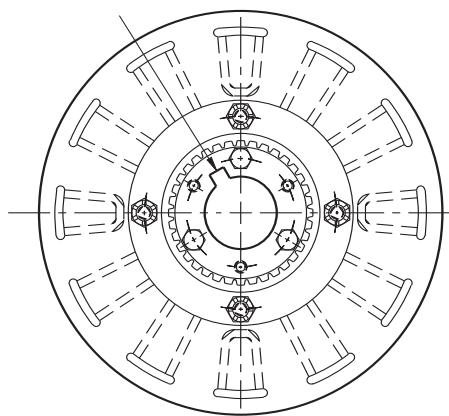

SFC-1225 Clutch Coupling per
I-25604 - 90 Volt, Inside Mounted,
1-1/2" Bore (Item 1), 1-3/4" Bore (Item 7).

These units, when used in conjunction with the correct Warner Electric conduit box, meet the standards of UL508 and are listed under guide card #NMTR, file #59164. These units are CSA certified under file #LR11543.

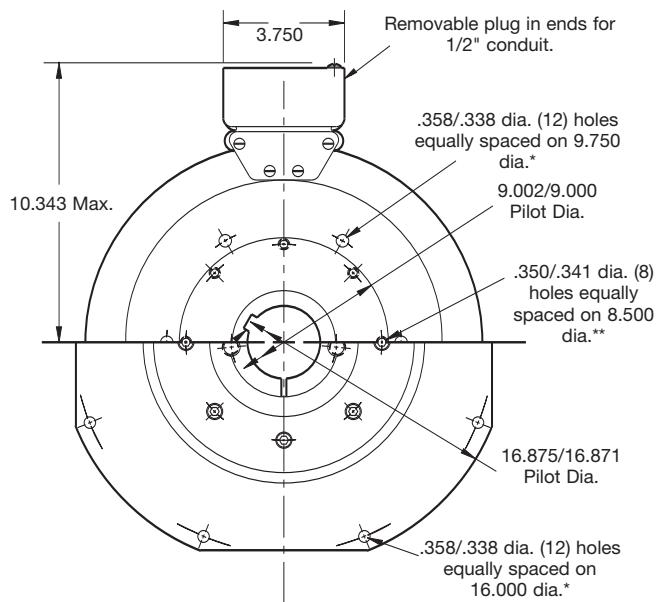

SFC-1525 Clutch Coupling Flange Mounted

Drawing I-25630

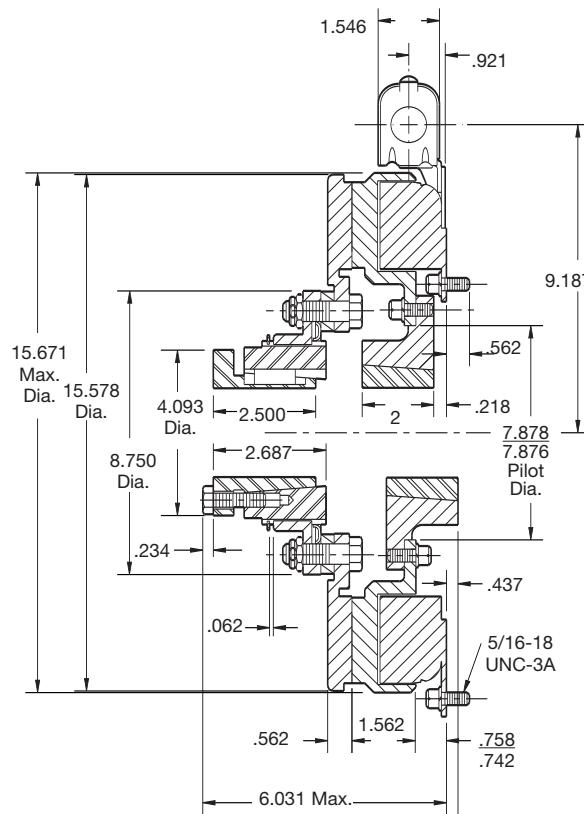

See page 30 for details
on Bushings.

Armature View

**Field View
(Inside & Outside Mounted)**

* Mounting holes are within .010 of true position relative to pilot diameter.

** Mounting holes are within .008 of true position relative to pilot diameter.

| | |
|------------------|----------------|
| Arm Shaft | .750 – 2.687 |
| Rotor Shaft | .937 – 3.000 |
| Static Torque | 700 lb. ft. |
| Maximum Speed | 2,000 rpm |
| Standard Voltage | D.C. 6, 24, 90 |

All dimensions are nominal unless otherwise noted.

Customer Shall Maintain:

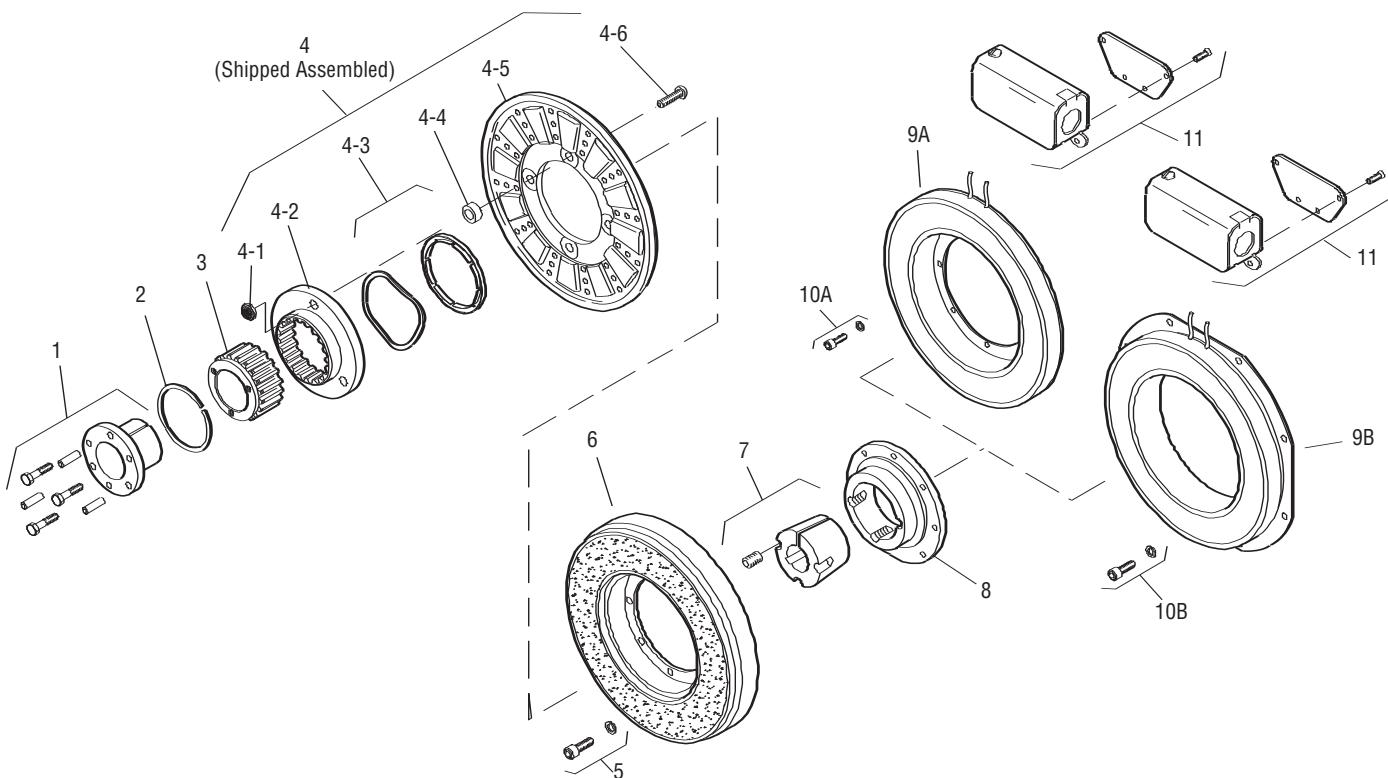

- Concentricity of field mounting pilot diameter with rotor mounting shaft within .006 T.I.R.
- Squareness of field mounting face with rotor mounting shaft within .006 T.I.R. measured at field mounting bolt circle.
- Rotor mounting shaft concentric with armature mounting shaft within .006 T.I.R.
- Angular alignment of shafts within 1/2 degree.

When Hub is Furnished by Customer:

Rotor mounting pilot diameter must be concentric with rotor mounting shaft within .006 T.I.R.

†SFC-1525 Clutch Coupling Flange Mounted Inside Mtd. Outside Mtd.

| Item | Description | SFC-1525 Part Number | Qty. |

| 11 | Conduit Box | 5200-101-012 | 1 |

*See page 30 for specific part numbers. †Optional LK facing available.

How to Order:

- Specify Bore Size for Item 1.
- Specify Bore Size for Item 7.
- Specify Voltage for Item 9A or 9B.
- Specify Inside Mounted for Items 9A and 10A or Outside Mounted for Items 9B and 10B.

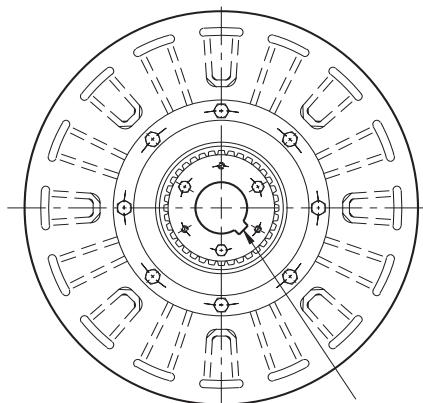

Example:

SFC-1525 Clutch Coupling per
I-25630 - 90 Volt, Inside Mounted,
1-1/2" Bore (Item 1), 1-3/4" Bore (Item 7).

These units, when used in conjunction with the correct Warner Electric conduit box, meet the standards of UL508 and are listed under guide card #NMTR, file #59164. These units are CSA certified under file #LR11543.

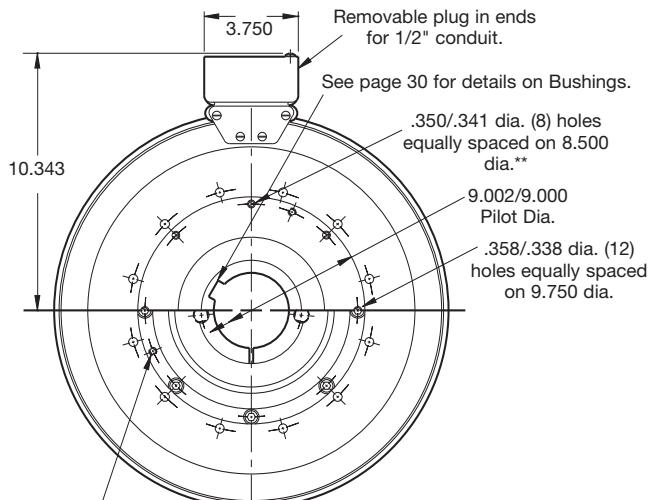

SFC-1525 H.T. Clutch Coupling, Hi-Torque Flange Mounted

Drawing I-25631

See page 30 for details on Bushing.

Armature View

5/16 UNC-2B (2) holes equally spaced for removal of rotor from hub.

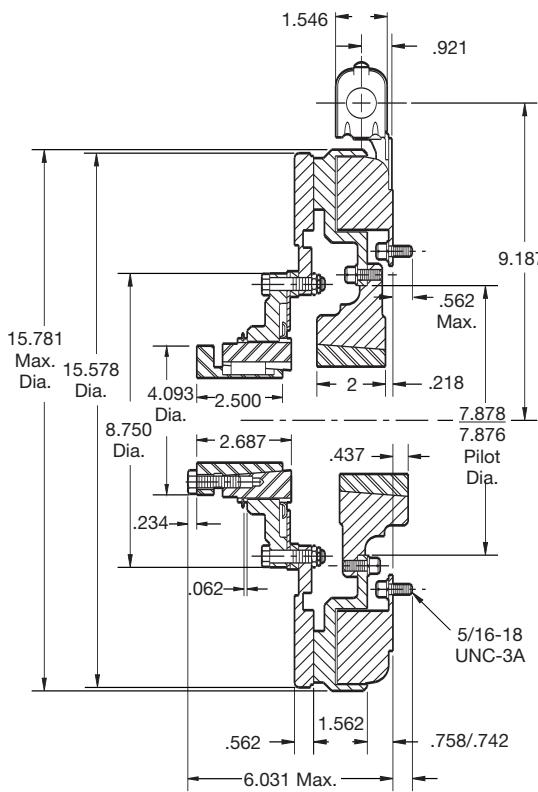

Field View

Customer Shall Maintain:

1. Concentricity of field mounting pilot diameter with rotor mounting shaft within .006 T.I.R.
2. Squareness of field mounting face with rotor mounting shaft within .006 T.I.R. measured at field mounting bolt circle.
3. Rotor mounting shaft concentric with armature mounting shaft within .006 T.I.R.
4. Angular alignment of shafts within 1/2 degree.

When Hub is Furnished by Customer:

Rotor mounting pilot diameter must be concentric with rotor mounting shaft within .006 T.I.R.

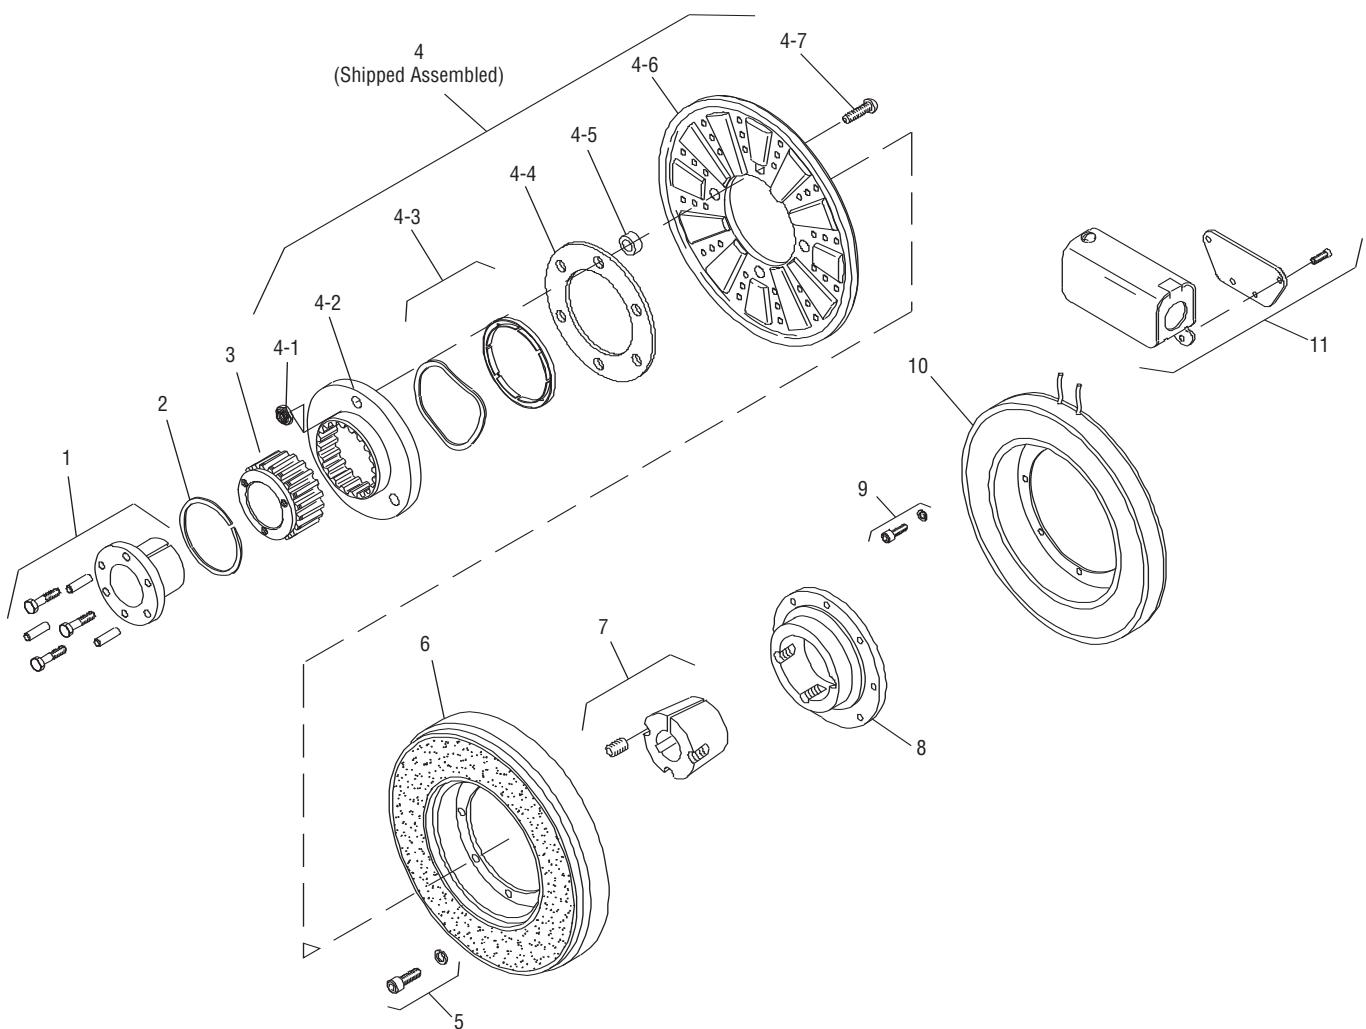

* Mounting holes are within .010 of true position relative to pilot diameter.

** Mounting holes are within .008 of true position relative to pilot diameter.

| | |
|------------------|---------------|
| Arm Shaft | .750 – 2.687 |
| Rotor Shaft | .937 – 3.000 |
| Static Torque | 1,350 lb. ft. |
| Maximum Speed | 2,000 rpm |
| Standard Voltage | D.C. 6, 90 |

All dimensions are nominal unless otherwise noted.

SFC-1525 H.T. Clutch Coupling, Hi-Torque Flange Mounted Inside Mt'd.

| Item | Description | SFC-1525, H.T. Part Number | Qty. |
|------|-----------------------------------|-------------------------------|------|
| 1 | Bushing 3/4" to 2-11/16" Bore | 180-0026 to 180-0057* | 1 |
| 2 | Retainer Ring | 748-0005 | 1 |

*See page 30 for specific part numbers.

How to Order:

- Specify Bore Size for Item 1.
- Specify Bore Size for Item 7.

Example:

SFC-1525 Clutch Coupling, Hi-Torque,
per I-25631 - 90 Volt

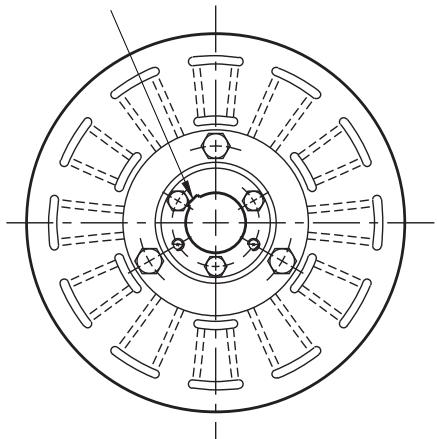

2" Bore (Item 1), 2-1/2" Bore (Item 7)

These units, when used in conjunction with the correct Warner Electric conduit box, meet the standards of UL508 and are listed under guide card #NMTR, file #59164. These units are CSA certified under file #LR11543.

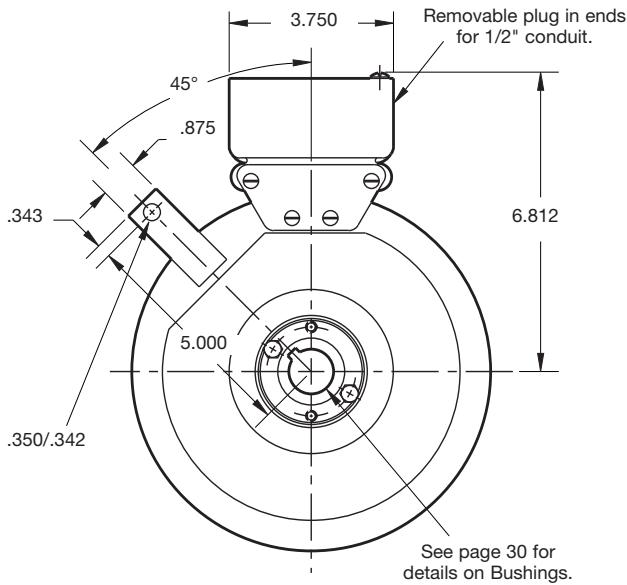

SFC-825 Clutch Coupling Bearing Mounted

Drawing I-25574

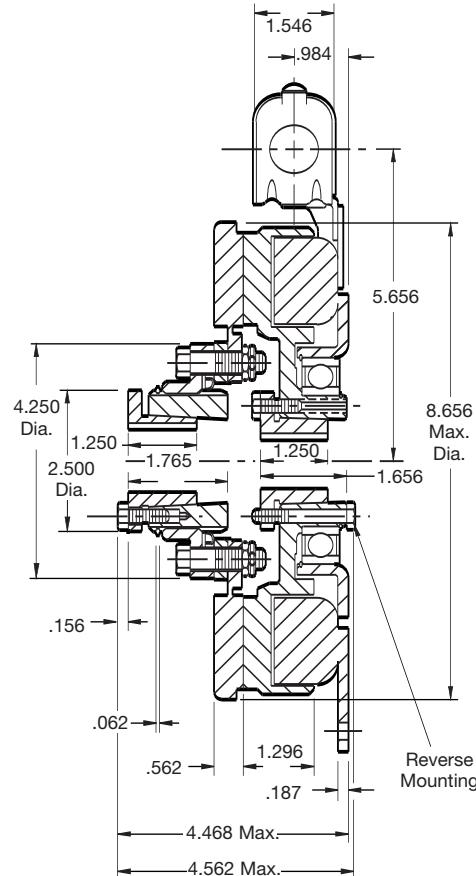

See page 30 for details on Bushings.

Armature View

Field View

| | |
|------------------|----------------|
| Arm Shaft | .500 – 1.500 |
| Rotor Shaft | .500 – 1.500 |
| Static Torque | 150 lb. ft. |
| Maximum Speed | 3,600 rpm |
| Standard Voltage | D.C. 6, 24, 90 |

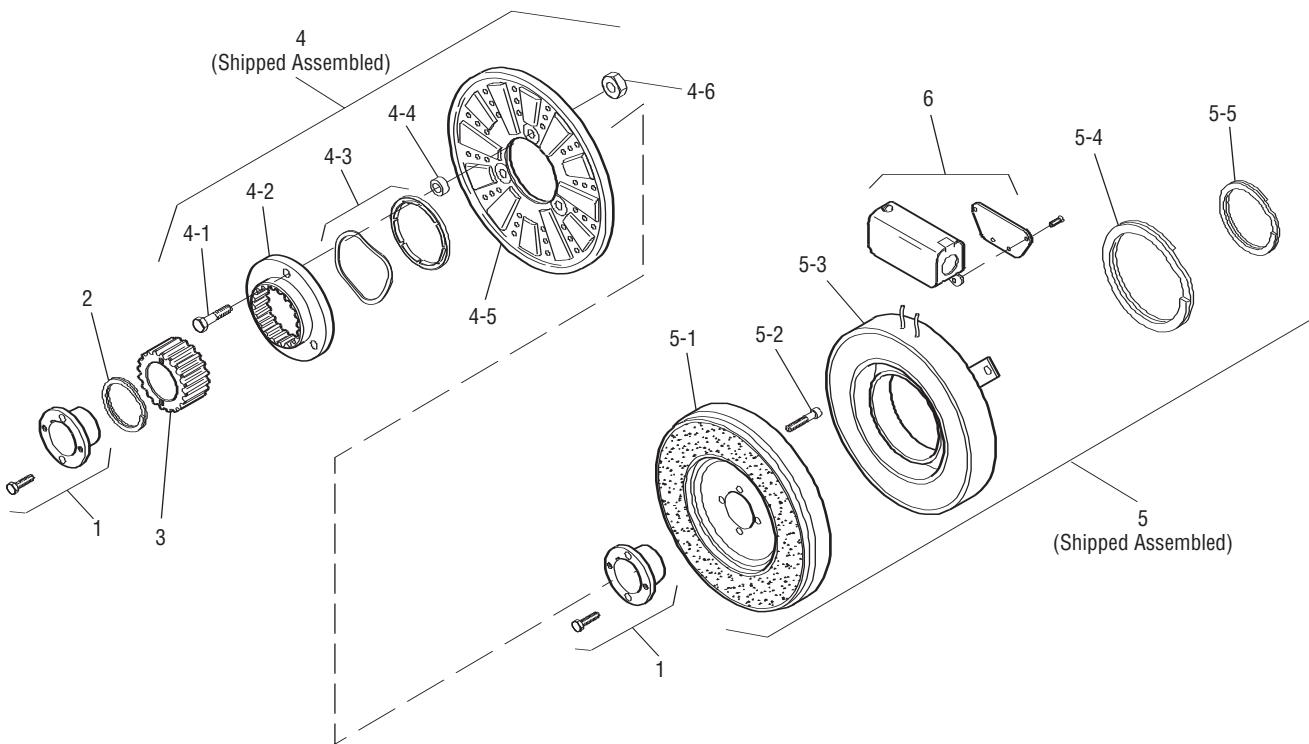

All dimensions are nominal unless otherwise noted.

Customer Shall Maintain:

1. Armature mounting shaft concentric with field and rotor mounting shaft within .006 T.I.R.
2. Angular alignment of shafts within 1/2 degree.

SFC-825 Clutch Coupling Bearing Mounted

| Item | Description | SF-825, B.M. | Part Number | Qty. |
|------|----------------------------|--------------|----------------------|------|
| 1 | Bushing* | | | 2 |
| | 1/2" to 1-1/2" Bore | | 180-0002 to 180-0018 | |

| Item | Description | Part Number | Qty. |
| 6 | Bushing | | |
| | 15/16" to 3" Bore | 180-0223 to 180-0256* | 1 |
| 7 | Conduit Box | 5200-101-012 | 1 |

*See page 30 for specific part numbers.

How to Order:

- Specify Bore Size for Item 1.
- Specify Bore Size for Item 6.
- Specify Voltage for Item 5.

Example:

SFC-1525 Clutch Coupling Hi-Torque per I-25644 - 90 Volt, 1" Bore

These units, when used in conjunction with the correct Warner Electric conduit box, meet the standards of UL508 and are listed under guide card #NMTR, file #59164. These units are CSA certified under file #LR11543.

Bushing Part Numbers

Browning Bushing

| Shaft Size | Keyway Size | Bushing Number | |
|------------|-------------|-----------------|----------|
| | | Warner Electric | Browning |
| 1/2 | 1/8 x 1/16 | 180-0002 | H-1 |
| 9/16 | 1/8 x 1/16 | 180-0003 | |
| 5/8 | 3/16 x 3/32 | 180-0004 | |
| 11/16 | 3/16 x 3/32 | 180-0005 | |

Warranty

Warner Electric LLC warrants that it will repair or replace (whichever it deems advisable) any product manufactured and sold by it which proves to be defective in material or workmanship within a period of one (1) year from the date of original purchase for consumer, commercial or industrial use.

This warranty extends only to the original purchaser and is not transferable or assignable without Warner Electric LLC's prior consent.

Warranty service can be obtained in the U.S.A. by returning any defective product, transportation charges prepaid, to the appropriate Warner Electric LLC factory. Additional warranty information may be obtained by writing the Customer Satisfaction Department, Warner Electric LLC, 449 Gardner Street, South Beloit, Illinois 61080, or by calling 815-389-3771.

A purchase receipt or other proof of original purchase will be required before warranty service is rendered. If found defective under the terms of this warranty, repair or replacement will be made, without charge, together with a refund for transportation costs. If found not to be defective, you will be notified and, with your consent, the item will be repaired or replaced and returned to you at your expense.

This warranty covers normal use and does not cover damage or defect which results from alteration, accident, neglect, or improper installation, operation, or maintenance.

Some states do not allow limitation on how long an implied warranty lasts, so the above limitation may not apply to you.

Warner Electric LLC's obligation under this warranty is limited to the repair or replacement of the defective product and in no event shall Warner Electric LLC be liable for consequential, indirect, or incidental damages of any kind incurred by reason of the manufacture, sale or use of any defective product. Warner Electric LLC neither assumes nor authorizes any other person to give any other warranty or to assume any other obligation or liability on its behalf.

WITH RESPECT TO CONSUMER USE OF THE PRODUCT, ANY IMPLIED WARRANTIES WHICH THE CONSUMER MAY HAVE ARE LIMITED IN DURATION TO ONE YEAR FROM THE DATE OF ORIGINAL CONSUMER PURCHASE. WITH RESPECT TO COMMERCIAL AND INDUSTRIAL USES OF THE PRODUCT, THE FOREGOING WARRANTY IS IN LIEU OF AND EXCLUDES ALL OTHER WARRANTIES, WHETHER EXPRESSED OR IMPLIED BY OPERATION OF LAW OR OTHERWISE, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS.

Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from state to state.

Changes in Dimensions and Specifications

All dimensions and specifications shown in Warner Electric catalogs are subject to change without notice. Weights do not include weight of boxing for shipment. Certified prints will be furnished without charge on request to Warner Electric.
