# Zero-Max ServoClass Couplings

- For high performance servo motor and demanding motion control applications
- High torsional stiffness for precision positioning
- Eco-Friendly, Adapted to RoHS Directive with no banned substances
- Low inertia for high speed applications
- Zero backlash and low hysteresis ensures repeatable precise positioning
- Clean Room Applications

Today's servo motor applications are more demanding than ever. The precision positioning requirements and high reverse load characteristics of AC and DC servomotor applications necessitate a coupling design that specifically addresses the needs of these sophisticated systems.

**Inertia and torsional stiffness** are critical features of a superior servo coupling. The inertia should be low so as not to add significantly to overall inertia of the servo system. The lower the inertia, the less energy required by the motor to move the system and therefore, higher acceleration is possible. The torsional stiffness should be high enough to prevent the coupling from winding up during acceleration, deceleration or reversing conditions. The torsional stiffness of the Zero-Max ServoClass coupling leads to

a higher system resonant frequency, which in most cases, is far above the operating range.

**Zero backlash** is another key requirement of a high performance servo coupling. A coupling may be considered zero backlash and still have a large amount of windup. Zero backlash is the ability of the coupling to maintain the same relative relationship between the input and output shaft without lost motion. The windup of the coupling can be detrimental to the servo system. A coupling with a high amount of windup will cause positioning errors to the servo system. The Zero-Max ServoClass coupling is a zero backlash coupling and it exhibits a very low amount of windup.

**Misalignment capability** of a coupling is also important in a motion control system. Usually, the alignment of a well manufactured servo

system will be very good. Over time and under high load conditions, this alignment may deteriorate. The coupling should be capable of handling this change. Also, the coupling should accommodate any lack of concentricity in the connected shafts as well as the stack up of tolerances in the motion assembly. Another important benefit of a high misalignment capability is the dispersion of reaction loads on the bearings and bushings in the system. The Zero-Max ServoClass coupling utilizes a design that provides adequate amounts of flexibility but does not sacrifice any of the torque capability or the torsional stiffness capability and therefore minimizes the reaction loads to the servo motor bearings.

#### Operating Temperature Range

-22° to +212°F  
-30° to +100°C

## ServoClass Couplings For Every Servo System Requirement

ServoClass couplings are available in single and double disc models. A total of 16 sizes are available. Double disc ServoClass models provide highest misalignment capability. Single disc ServoClass models provide a smaller package coupling with more torsional and axial stiffness than the Double disc model.

**Torque ratings** for ServoClass couplings range from 4.43 to 530 lb-in (.5 to 60 Nm). These ratings are based on the minimum bore of the coupling. These couplings can accommodate bores sizes from 4.0 mm to a maximum of 30 mm. Contact Zero-Max for larger or smaller bore sizes.

**Hubs and center members** of ServoClass couplings are manufactured of aluminum alloy for high strength and durability. They are treated to prevent oxidation and to preserve appearance. Disc members are made of 304 stainless steel providing torsional stiffness and some misalignment capability.

**Coupling assembly/hub design.** ServoClass couplings are precisely assembled using highest strength, corrosion resistant fasteners. The couplings also have integral clamp style hubs for fast and easy mounting. The design allows for specifying combinations of inch and mm hub bore sizes and styles.

**RoHS Compliant.** ServoClass couplings are manufactured of RoHS compliant materials and contain no banned substances.

## Bore Size and Operating Torque

Bore size affects and limits the operating torque of the coupling

Model	Bore		Coupling Operating Torque	
	Inch	mm	Inch Lb's	Nm
SD/SC020R	0.1875	5	11	1.2
SD/SC030R	0.1875	5	25	2.8
	0.236	6	30	3.4
SD/SC040R	0.3125	8	80	9
SD/SC050R	0.375	10	195	22
SD/SC060R	0.500	12	451	51

## Standard Motor Application

1. Determine the speed-revolutions per minute (RPM) and horsepower (HP). Then calculate the torque (T), in inch-pounds, to be transmitted:  

$$T = \frac{HP \times 63,025}{RPM}$$
2. Select the service factor (K) according to the characteristics of the load or application. See chart below for load characteristics and service factor. Calculate the coupling selection torque (TD) based on the appropriate service factor:  

$$TD = T \times K$$
3. Select a coupling with a torque rating equal or greater than TD.
4. Check the dimensions and bore range of the coupling selected with the application requirements.

## Servomotor Application

Although servomotors have different torque values relative to RPM, and torque values change relative to continuous or intermittent duty, it is suggested to use the peak torque rating of the servomotor multiplied by a service factor in determining the coupling selection:

$$TS = TM \times KS$$

TS is the torque used to select the coupling; TM is the peak torque of the servomotor; KS is the servo service factor of the application. Generally, KS is a value within the range of 1.3 to 1.5 for ServoClass coupling applications. 1.3 is a factor applied to typical reverse-load, continuous-duty applications. 1.5 is a factor applied to the most demanding high reverse-load, rapid-acceleration applications. Example:

Servomotor Peak Torque: 7.59 inch-pounds  
 Rated Torque: 2.53 inch-pounds  
 Shaft Diameter: .375 inch

$$TS = 7.59 \times 1.5$$

$$TS = 11.39 \text{ inch-pounds of torque}$$

Coupling selection: SC 020, rated at 13 inch-pounds of torque. .375 bore is OK.

## Additional ServoClass Coupling Applications

The ServoClass coupling was designed specifically for the servo motor market. Other applications include stepper motors and encoders. Typically these motors are used in applications that involve positioning devices such as linear ball screws, actuators, and positioning systems (X, Y and Z-axis). The ServoClass is ideal for use in machine tools, printing machines, pick and place machines and many other high precision applications. If there's a servomotor in the system, a ServoClass coupling should be used!

## Natural Frequency & Resonance

In servomotor systems, torsional vibration can be caused by acceleration, deceleration, driver characteristics and other factors. While torsional vibration is inherent in power transmission systems, it is important that its frequency and amplitude be minimized. Torsional vibration can cause component failure or poor system performance. By selecting the proper coupling that places the natural frequency outside the range of 150-400 Hz, the effects of torsional vibration or resonance can be reduced. The calculated natural frequency of the system should be 1.3 to 1.5 times greater than this range.

The natural torsional frequency can be calculated from a 2 mass system approximation using the following equation.

$$F = 1/2\pi \times \sqrt{\frac{K \times (J_1 + J_2)}{J_1 \times J_2}}$$

Where:

F = Natural Frequency in Hz

J<sub>1</sub> = Inertia of the Motor

J<sub>2</sub> = Inertia of the load

K = Torsional Stiffness of the Coupling

Other factors such as system gain, elasticity of the system and dampening can also be included in the equation. Please call us for a natural frequency analysis of your servo system.

Load Characteristics			
Constant	Slight fluctuation	Medium fluctuation	Great fluctuation

Warranty. Zero-Max, Inc. the manufacturer, warrants that for a period of 12 months from date of shipment it will repair, or at its option, replace any new apparatus which proves defective in material or workmanship, or which does not conform to applicable drawings and specifications approved by the manufacturer. All repairs and replacements shall be F.O.B. factory. All claims must be made in writing to the manufacturer. • In no event and under no circumstances shall manufacturer be liable for (a) damages in shipment; (b) failures or damages due to misuse, abuse, improper installation or abnormal conditions of temperature, dirt, water or corrosives; (c) failures due to operation, intentional or otherwise, above rated capacities, and (d) non-authorized expenses for removal, inspection, transportation, repair or rework. Nor shall manufacturer ever be liable for consequential and incidental damages, or in any amount greater than the purchase price of the apparatus. • Zero Max, Inc. reserves the right to discontinue models or to change specifications at any time without notice. No discontinuance or change shall create any liability on the part of Zero-Max, Inc. in respect to its products in the hands of customers or products on order not incorporating such changes even though delivered after any such change. • This warranty is in LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING (BUT NOT LIMITED TO) ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. THE TERMS OF THIS WARRANTY CONSTITUTE ALL BUYER'S OR USER'S SOLE AND EXCLUSIVE REMEDY, AND ARE IN LIEU OF ANY RIGHT TO RECOVER FOR NEGLIGENCE, BREACH OF WARRANTY, STRICT TORT LIABILITY OR UPON ANY OTHER THEORY. Any legal proceedings arising out of the sale or use of this apparatus must be commenced within 18 months of the date of purchase. • CAUTION: Rotating equipment must be guarded. Also refer to OSHA specifications and recommendations. • Zero-Max®, CD®, ETP®, ServoClass®, Torq-Tender®, Control-Flex®, Posi-Lok® and Roh'lix® are registered trademarks of Zero-Max, Inc. In U.S.A.
